## Ask the right question

Re:

Waterloo Regional council has approved of the following question to be placed on the municipal election ballot this October.

"Should the Region of Waterloo continue to fluoridate your municipal water?"

In previous referendums, voters didn't realize what they were voting for and the powers that be would like to keep it that way. In none of the previous votes on this issue were voters told that Waterloo fluoridates their water not with food grade fluoride, but with a toxic by-product called hydrofluorosilicic acid which contains, of all things, lead, mercury and arsenic. Hydrofluorosilicic acid is so toxic that it's against the law to dump it anywhere, but the powers that be want you to believe that it's safe to ingest. Don't be fooled.

Hydrofluorosilicic acid is not safe and there are many studies that have been done to substantiate this fact. They don't want us to know exactly what's being used to fluoridate our water, that's why the question is worded the way it is. The region is holding a public meeting on March 9 at 6 p.m. at the regional headquarters on Frederick Street in Kitchener. Come out and voice your opposition to the wording of this question.
