

Long-term effects

Re:

The debate goes on and on. The fact is there is no doubt that fluoridation prevents cavities, however, there are side effects also. A study has shown that a small percentage of the population may develop rashes, dry skin and eczema. Heaven only knows what the long-term effects can be when ingested.

I don't see why we allow some people to suffer the side effects when the same protection for teeth can be obtained from toothpaste with fluoride.
