Science proves fluoride is unsafe

Published on Mar 24, 2010

One point that seems to be missing with the fluoride issue is that it has always been the theory that fluoride is safe.

Well new science on the effects of fluoride on the human body and the resulting waste water that is leaching into our environment makes me wonder why we are even taking this to a vote.

The message I am getting from the politician is that they will decide for me what's in my best interests.

How can a dentist say they are concerned for little kid's teeth and then ignore the possible thyroid issue for the parents or osteoporosis for grandma? What right does anyone have in voting on a product that goes against informed consent?

If I vote no on water fluoridation because I am afraid of adding fluoride to my diet, and the rest of the voters vote yes, will I have a choice any more? What about people on dialysis? Are they expected to find the money to buy and maintain an R/O unit? What if you're a single mom with an infant on baby formula? Where's the dentist when little Johnny loses his ability to maintain his adult teeth when they are poisoned with dental fluorosis?

We keep scaling back the concentrations and yet insist it is and has always been perfectly safe to drink with out limitation.

How can the individual decide if they had enough fluoride if they can't get to a water source that is not fluoridated?
