Vote to protect our ground water

Published on Oct 13, 2010

Fluoride is recognized as being an activator chemical that has the potential to increase the toxicity of other chemicals exposed to it.

Fluoridated water takes an ominous tone when one considers the chemical risks associated with leaking pipes, broken water mains or when the city regularly flushes out the system. I do not find it morally or ethically correct to allow one municipality to have a vote which could risk the long-term security of our shared regional water resources but none the less, the choice is Waterloo's to make during the upcoming election.

As the largest region in Canada dependent on ground source drinking water it is my sincere hope that Waterloo residents will take the time to vote and say No to fluoridated water in order to protect and preserve our shared water resources for the long term.

Louissette Lanteigne *Waterloo*
