Where's the science from dentists

Published on Jun 30, 2010

The phrase, "Where's the beef" was coined back in the 80's by a lovable old lady.

Today I'd like to introduce a new phrase for our time. It is, "Where's the science?" The dentists at the recent debate on water fluoridation were singing the same old tune — we know what's best for you, fluoride is good for you and reduces cavities, we have the science to prove it (they don't).

This go around they have added another statement to their claims about fluoride. "Fluoride is a nutrient."

Unbelievable! Next they'll be telling us that lead, arsenic and mercury are nutrients as well.

Folks, don't be fooled by these guys.

Hydrofluorosilicic acid, in spite of what you're being told, has never been proven safe to ingest or effective at reducing cavities.

And, there are no safe limits for the ingestion of lead, mercury or arsenic.

Now, I want to hear the whole choir this time. "Where's the science?"

Robert Falla *Waterloo*
